

XSLT

extensible stylesheet language transformation

tutorialspoint
SIMPLY EASY LEARNING

www.tutorialspoint.com

<https://www.facebook.com/tutorialspointindia>

<https://twitter.com/tutorialspoint>

About the Tutorial

EXtensible Stylesheet Language Transformation, commonly known as XSLT, is a way to transform the XML document into other formats such as XHTML.

This tutorial explains the basics of XSLT. It contains chapters discussing all the basic components of XSLT with suitable examples.

Audience

This tutorial has been prepared for beginners to help them in understanding the basic concepts related to XSLT. This tutorial will give you enough understanding on XSLT from where you can take yourself to a higher level of expertise.

Prerequisites

Before proceeding with this tutorial, you should have a basic knowledge of XML, HTML, and JavaScript.

1. XSLT – Overview

XSL

Before learning XSLT, we should first understand XSL which stands for **E**x~~tensible~~ **S**tylesheet **L**anguage. It is similar to XML as CSS is to HTML.

Need for XSL

In case of HTML document, tags are predefined such as table, div, and span; and the browser knows how to add style to them and display those using CSS styles. But in case of XML documents, tags are not predefined. In order to understand and style an XML document, World Wide Web Consortium (W3C) developed XSL which can act as XML based Stylesheet Language. An XSL document specifies how a browser should render an XML document.

Following are the main parts of XSL:

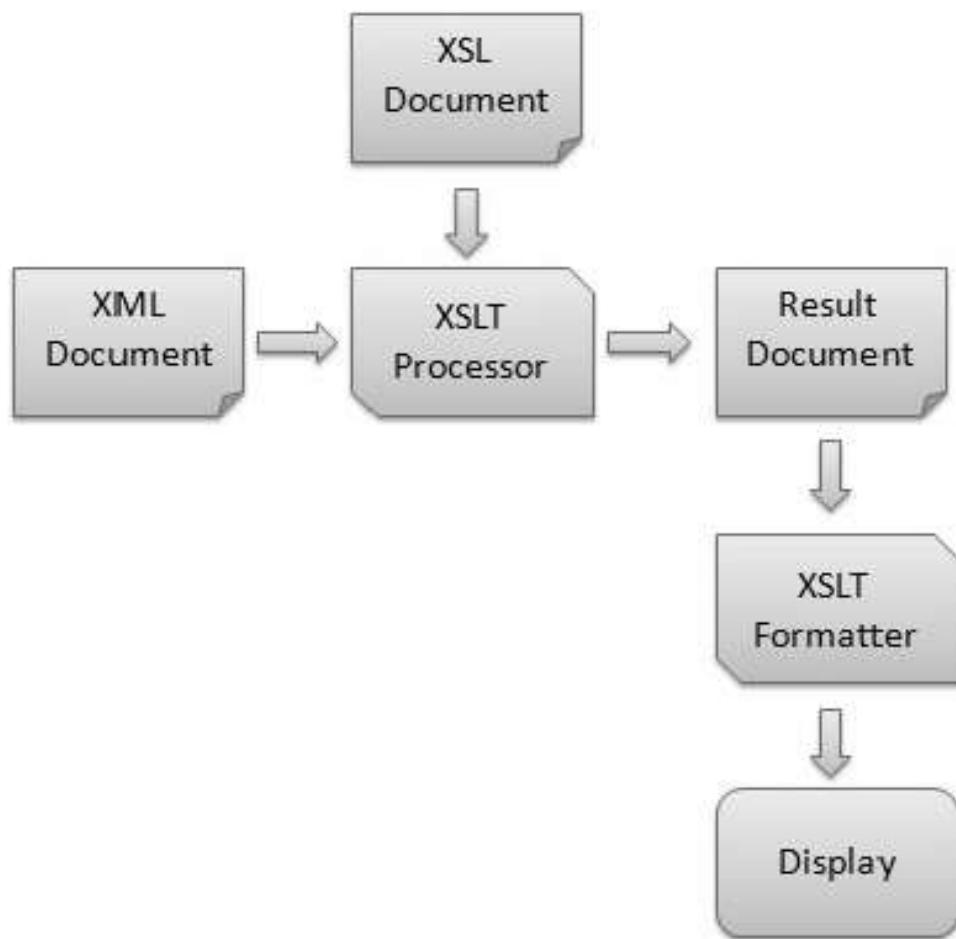

- **XSLT** - used to transform XML document into various other types of document.
- **XPath** - used to navigate XML document.
- **XSL-FO** - used to format XML document.

What is XSLT

XSLT, Extensible Stylesheet Language Transformations, provides the ability to transform XML data from one format to another automatically.

How XSLT Works

An XSLT stylesheet is used to define the transformation rules to be applied on the target XML document. XSLT stylesheet is written in XML format. XSLT Processor takes the XSLT stylesheet and applies the transformation rules on the target XML document and then it generates a formatted document in the form of XML, HTML, or text format. This formatted document is then utilized by XSLT formatter to generate the actual output which is to be displayed to the end-user.

Advantages

Here are the advantages of using XSLT:

- Independent of programming. Transformations are written in a separate xsl file which is again an XML document.
- Output can be altered by simply modifying the transformations in xsl file. No need to change any code. So Web designers can edit the stylesheet and can see the change in the output quickly.

2. XSLT – Syntax

Let's suppose we have the following sample XML file, students.xml, which is required to be transformed into a well-formatted HTML document.

students.xml

```
<?xml version="1.0"?>

<class>

    <student rollno="393">
        <firstname>Dinkar</firstname>
        <lastname>Kad</lastname>
        <nickname>Dinkar</nickname>
        <marks>85</marks>
    </student>
    <student rollno="493">
        <firstname>Vaneet</firstname>
        <lastname>Gupta</lastname>
        <nickname>Vinni</nickname>
        <marks>95</marks>
    </student>
    <student rollno="593">
        <firstname>Jasvir</firstname>
        <lastname>Singh</lastname>
        <nickname>Jazz</nickname>
        <marks>90</marks>
    </student>
</class>
```

We need to define an XSLT style sheet document for the above XML document to meet the following criteria:

- Page should have a title **Students**.
- Page should have a table of student details.
- Columns should have following headers: Roll No, First Name, Last Name, Nick Name, Marks
- Table must contain details of the students accordingly.

Step 1: Create XSLT document

Create an XSLT document to meet the above requirements, name it as students.xsl and save it in the same location where students.xml lies.

students.xsl

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- xsl stylesheet declaration with xsl namespace:
Namespace tells the xlst processor about which element is to be processed and
which is used for output purpose only
-->
<xsl:stylesheet version="1.0"
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<!-- xsl template declaration:
template tells the xlst processor about the section of xml document which is to be
formatted. It takes an XPath expression.
In our case, it is matching document root element and will tell processor to
process the entire document with this template.
-->
<xsl:template match="/">
<!-- HTML tags
Used for formatting purpose. Processor will skip them and browser will simply
render them.
-->
<html>
<body>
<h2>Students</h2>
<table border="1">
<tr bgcolor="#9acd32">
<th>Roll No</th>
<th>First Name</th>
<th>Last Name</th>
<th>Nick Name</th>
<th>Marks</th>
</tr>
<!-- for-each processing instruction
Looks for each element matching the XPAth expression
-->
```

```

<xsl:for-each select="class/student">
  <tr>
    <td>
      <!-- value-of processing instruction
          process the value of the element matching the XPath expression
      -->
      <xsl:value-of select="@rollno"/>
    </td>
    <td><xsl:value-of select="firstname"/></td>
    <td><xsl:value-of select="lastname"/></td>
    <td><xsl:value-of select="nickname"/></td>
    <td><xsl:value-of select="marks"/></td>
  </tr>
</xsl:for-each>
</table>
</body>
</html>
</xsl:template>

</xsl:stylesheet>

```

Step 2: Link the XSLT Document to the XML Document

Update student.xml document with the following xml-stylesheet tag. Set href value to students.xsl

```

<?xml version="1.0"?>
<?xml-stylesheet type="text/xsl" href="students.xsl"?>
<class>
  ...
</class>

```

Step 3: View the XML Document in Internet Explorer

students.xml

```
<?xml version="1.0"?>
<?xml-stylesheet type="text/xsl" href="students.xsl"?>
<class>
  <student rollno="393">
    <firstname>Dinkar</firstname>
    <lastname>Kad</lastname>
    <nickname>Dinkar</nickname>
    <marks>85</marks>
  </student>
  <student rollno="493">
    <firstname>Vaneet</firstname>
    <lastname>Gupta</lastname>
    <nickname>Vinni</nickname>
    <marks>95</marks>
  </student>
  <student rollno="593">
    <firstname>Jasvir</firstname>
    <lastname>Singh</lastname>
    <nickname>Jazz</nickname>
    <marks>90</marks>
  </student>
</class>
```

Output

The screenshot shows a Windows Internet Explorer window displaying the output of an XSLT transformation. The title bar reads "E:\xslt\students.xml - Windows Internet Explorer". The address bar shows the URL "E:\xslt\students.xml". The page content starts with a large bold heading "Students". Below it is a table with the following data:

Roll No	First Name	Last Name	Nick Name	Marks
393	Dinkar	Kad	Dinkar	85
493	Vaneet	Gupta	Vinni	95
593	Jasvir	Singh	Jazz	90

At the bottom of the browser window, there is a status bar with the text "Computer | Protected Mode: Off" and a zoom level indicator "100%".

3. XSLT – Template

<xsl:template> defines a way to reuse templates in order to generate the desired output for nodes of a particular type/context.

Declaration

Following is the syntax declaration of <xsl:template> element.

```
<xsl:template  
    name= QName  
    match = Pattern  
    priority = number  
    mode = QName >  
</xsl:template>
```

Attributes

Name	Description
name	Name of the element on which template is to be applied.
match	Pattern which signifies the element(s) on which template is to be applied.
priority	Priority number of a template. Matching template with low priority is not considered in front of high priority template.
mode	Allows element to be processed multiple times to produce a different result each time.

Elements

Number of occurrences	Unlimited
Parent elements	xsl:stylesheet, xsl:transform
Child elements	xsl:apply-imports, xsl:apply-templates, xsl:attribute, xsl:call-template, xsl:choose, xsl:comment, xsl:copy, xsl:copy-of, xsl:element, xsl:fallback, xsl:for-each, xsl:if, xsl:message, xsl:number, xsl:param, xsl:processing-instruction, xsl:text, xsl:value-of, xsl:variable, output elements

Demo Example

This template rule has a pattern that identifies `<student>` elements and produces an output in a tabular format.

students.xml

```
<?xml version="1.0"?>
<?xml-stylesheet type="text/xsl" href="students.xsl"?>
<class>
    <student rollno="393">
        <firstname>Dinkar</firstname>
        <lastname>Kad</lastname>
        <nickname>Dinkar</nickname>
        <marks>85</marks>
    </student>
    <student rollno="493">
        <firstname>Vaneet</firstname>
        <lastname>Gupta</lastname>
        <nickname>Vinni</nickname>
        <marks>95</marks>
    </student>
    <student rollno="593">
        <firstname>Jasvir</firstname>
        <lastname>Singh</lastname>
        <nickname>Jazz</nickname>
        <marks>90</marks>
    </student>
</class>
```

students_imports.xsl

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">

<xsl:template match="/">
<html>
<body>
<h2>Students</h2>
<table border="1">
<tr bgcolor="#9acd32">
<th>Roll No</th>
<th>First Name</th>
<th>Last Name</th>
<th>Nick Name</th>
<th>Marks</th>
</tr>
<xsl:for-each select="class/student">
<tr>
<td>
<xsl:value-of select="@rollno"/>
</td>
<td><xsl:value-of select="firstname"/></td>
<td><xsl:value-of select="lastname"/></td>
<td><xsl:value-of select="nickname"/></td>
<td><xsl:value-of select="marks"/></td>
</tr>
</xsl:for-each>
</table>
</body>
</html>
</xsl:template>

</xsl:stylesheet>
```

Output

The screenshot shows a Microsoft Internet Explorer window displaying an XSLT transformation result. The title bar reads "E:\xslt\students.xml - Windows Internet Explorer". The address bar shows "E:\xslt\students.xml". The page content starts with a large bold heading "Students". Below it is a table with the following data:

Roll No	First Name	Last Name	Nick Name	Marks
393	Dinkar	Kad	Dinkar	85
493	Vaneet	Gupta	Vinni	95
593	Jasvir	Singh	Jazz	90

At the bottom of the browser window, there is a status bar with the text "Computer | Protected Mode: Off" and a zoom level indicator "100%".

4. XSLT – <value-of>

<xsl:value-of> tag puts the value of the selected node as per XPath expression, as text.

Declaration

Following is the syntax declaration of <xsl:value-of> element

```
<xsl:value-of  
    select = Expression  
    disable-output-escaping = "yes" | "no" >  
</xsl:value-of>
```

Attributes

Name	Description
Select	XPath Expression to be evaluated in current context.
disable-output-escaping	Default-"no". If "yes", output text will not escape xml characters from text.

Elements

Number of occurrences	Unlimited
Parent elements	xsl:attribute, xsl:comment, xsl:copy, xsl:element, xsl:fallback, xsl:foreach, xsl:if, xsl:message, xsl:otherwise, xsl:param, xsl:processing-instruction, xsl:template, xsl:variable, xsl:when, xsl:with-param, output elements
Child elements	None

Demo Example

This example creates a table of <student> element with its attribute **rollno** and its child <firstname>, <lastname>, <nickname>, and <marks>.

students.xml

```
<?xml version="1.0"?>
<?xml-stylesheet type="text/xsl" href="students.xsl"?>
<class>
  <student rollno="393">
    <firstname>Dinkar</firstname>
    <lastname>Kad</lastname>
    <nickname>Dinkar</nickname>
    <marks>85</marks>
  </student>
  <student rollno="493">
    <firstname>Vaneet</firstname>
    <lastname>Gupta</lastname>
    <nickname>Vinni</nickname>
    <marks>95</marks>
  </student>
  <student rollno="593">
    <firstname>Jasvir</firstname>
    <lastname>Singh</lastname>
    <nickname>Jazz</nickname>
    <marks>90</marks>
  </student>
</class>
```

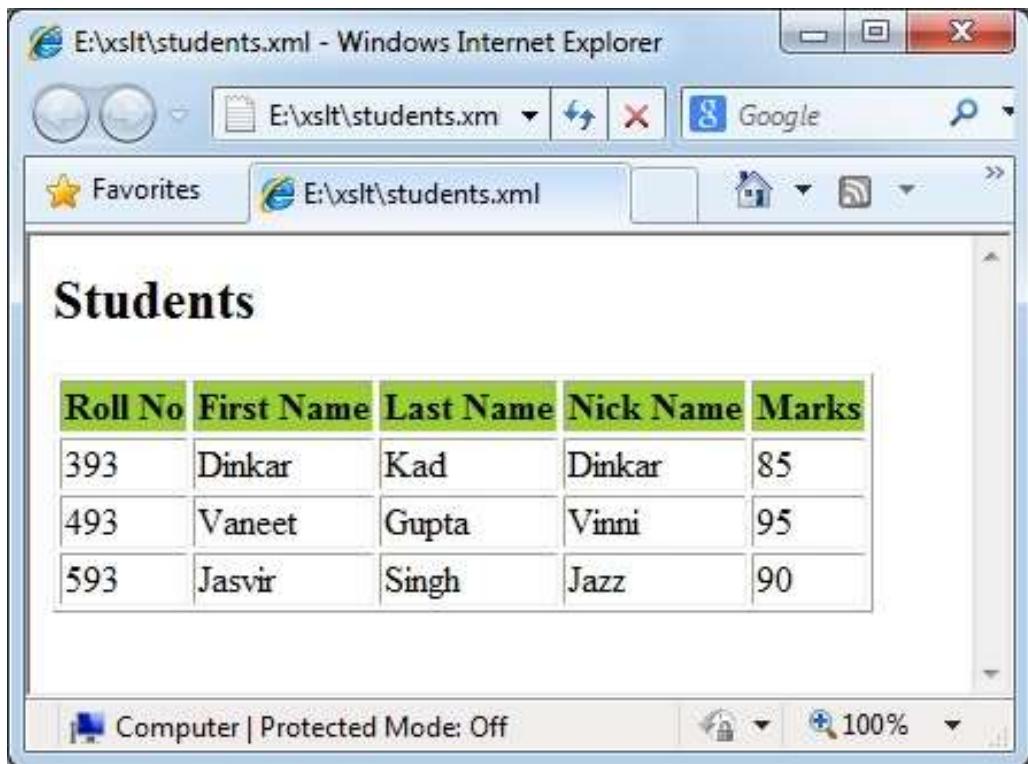

students.xsl

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">

<xsl:template match="/">
<html>
<body>
<h2>Students</h2>
<table border="1">
<tr bgcolor="#9acd32">
<th>Roll No</th>
<th>First Name</th>
<th>Last Name</th>
<th>Nick Name</th>
<th>Marks</th>
</tr>
<xsl:for-each select="class/student">
<tr>
<td>
<xsl:value-of select="@rollno"/>
</td>
<td><xsl:value-of select="firstname"/></td>
<td><xsl:value-of select="lastname"/></td>
<td><xsl:value-of select="nickname"/></td>
<td><xsl:value-of select="marks"/></td>
</tr>
</xsl:for-each>
</table>
</body>
</html>
</xsl:template>

</xsl:stylesheet>
```

Verify the output

The screenshot shows a Windows Internet Explorer window displaying an XSLT transformation result. The title bar reads "E:\xslt\students.xml - Windows Internet Explorer". The address bar shows "E:\xslt\students.xml". The main content area has a heading "Students" and a table with the following data:

Roll No	First Name	Last Name	Nick Name	Marks
393	Dinkar	Kad	Dinkar	85
493	Vaneet	Gupta	Vinni	95
593	Jasvir	Singh	Jazz	90

The status bar at the bottom indicates "Computer | Protected Mode: Off" and "100%".

5. XSLT – <for-each>

<xsl:for-each> tag applies a template repeatedly for each node.

Declaration

Following is the syntax declaration of **<xsl:for-each>** element

```
<xsl:for-each  
    select = Expression >  
</xsl:for-each>
```

Attributes

Name	Description
select	XPath Expression to be evaluated in current context to determine the set of nodes to be iterated.

Elements

Number of occurrences	Unlimited
Parent elements	xsl:attribute, xsl:comment, xsl:copy, xsl:element, xsl:fallback, xsl:for-each, xsl:if, xsl:message, xsl:otherwise, xsl:param, xsl:processing-instruction, xsl:template, xsl:variable, xsl:when, xsl:with-param, output elements
Child elements	xsl:apply-imports, xsl:apply-templates, xsl:attribute, xsl:call-template, xsl:choose, xsl:comment, xsl:copy, xsl:copy-of, xsl:element, xsl:fallback, xsl:for-each, xsl:if, xsl:message, xsl:number, xsl:processing-instruction, xsl:sort, xsl:text, xsl:value-of, xsl:variable

Demo Example

This example creates a table of `<student>` element with its attribute `rollno` and its child `<firstname>`, `<lastname>`, `<nickname>` and `<marks>` by iterating over each student.

students.xml

```

<?xml version="1.0"?>
<?xml-stylesheet type="text/xsl" href="students.xsl"?>
<class>
    <student rollno="393">
        <firstname>Dinkar</firstname>
        <lastname>Kad</lastname>
        <nickname>Dinkar</nickname>
        <marks>85</marks>
    </student>
    <student rollno="493">
        <firstname>Vaneet</firstname>
        <lastname>Gupta</lastname>
        <nickname>Vinni</nickname>
        <marks>95</marks>
    </student>
    <student rollno="593">
        <firstname>Jasvir</firstname>
        <lastname>Singh</lastname>
        <nickname>Jazz</nickname>
        <marks>90</marks>
    </student>
</class>

```

students.xsl

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">

<xsl:template match="/">
    <html>

```

```
<body>
<h2>Students</h2>

<table border="1">
  <tr bgcolor="#9acd32">
    <th>Roll No</th>
    <th>First Name</th>
    <th>Last Name</th>
    <th>Nick Name</th>
    <th>Marks</th>
  </tr>
  <xsl:for-each select="class/student">
    <tr>
      <td>
        <xsl:value-of select="@rollno"/>
      </td>
      <td><xsl:value-of select="firstname"/></td>
      <td><xsl:value-of select="lastname"/></td>
      <td><xsl:value-of select="nickname"/></td>
      <td><xsl:value-of select="marks"/></td>
    </tr>
  </xsl:for-each>
</table>
</body>
</html>
</xsl:template>

</xsl:stylesheet>
```

Output

The screenshot shows a Windows Internet Explorer window displaying the output of an XSLT transformation. The title bar reads "E:\xslt\students.xml - Windows Internet Explorer". The address bar shows "E:\xslt\students.xml". The page content is titled "Students" and contains a table with student data:

Roll No	First Name	Last Name	Nick Name	Marks
393	Dinkar	Kad	Dinkar	85
493	Vaneet	Gupta	Vinni	95
593	Jasvir	Singh	Jazz	90

The status bar at the bottom indicates "Computer | Protected Mode: Off" and "100%".

6. XSLT – <sort>

<xsl:sort> tag specifies a sort criteria on the nodes.

Declaration

Following is the syntax declaration of **<xsl:sort>** element.

```
<xsl:sort
    select = string-expression
    lang = { nmtoken }
    data-type = { "text" | "number" | QName }
    order = { "ascending" | "descending" }
    case-order = { "upper-first" | "lower-first" } >
</xsl:sort>
```

Attributes

Name	Description
select	Sorting key of the node.
lang	Language alphabet used to determine sort order.
data-type	Data type of the text.
order	Sorting order. Default is "ascending"
case-order	Sorting order of string by capitalization. Default is "upper-first".

Elements

Number of occurrences	Unlimited
Parent elements	xsl:apply-templates, xsl:for-each
Child elements	None

Demo Example

This example creates a table of `<student>` element with its attribute `rollno` and its child `<firstname>`, `<lastname>`, `<nickname>`, and `<marks>` by iterating over each student sort them by first name.

students.xml

```
<?xml version="1.0"?>
<?xml-stylesheet type="text/xsl" href="students.xsl"?>
<class>
  <student rollno="393">
    <firstname>Dinkar</firstname>
    <lastname>Kad</lastname>
    <nickname>Dinkar</nickname>
    <marks>85</marks>
  </student>
  <student rollno="493">
    <firstname>Vaneet</firstname>
    <lastname>Gupta</lastname>
    <nickname>Vinni</nickname>
    <marks>95</marks>
  </student>
  <student rollno="593">
    <firstname>Jasvir</firstname>
    <lastname>Singh</lastname>
    <nickname>Jazz</nickname>
    <marks>90</marks>
  </student>
</class>
```

students.xsl

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform">

  <xsl:template match="/">
    <html>
      <body>
        <h2>Students</h2>
        <table border="1">
          <tr bgcolor="#9acd32">
            <th>Roll No</th>
            <th>First Name</th>
            <th>Last Name</th>
            <th>Nick Name</th>
            <th>Marks</th>
          </tr>
          <xsl:for-each select="class/student">
            <xsl:sort select="firstname"/>
            <tr>
              <td>
                <xsl:value-of select="@rollno"/>
              </td>
              <td><xsl:value-of select="firstname"/></td>
              <td><xsl:value-of select="lastname"/></td>
              <td><xsl:value-of select="nickname"/></td>
              <td><xsl:value-of select="marks"/></td>
            </tr>
          </xsl:for-each>
        </table>
      </body>
    </html>
  </xsl:template>
</xsl:stylesheet>

```

Output

The screenshot shows a Windows Internet Explorer window displaying the output of an XSLT transformation. The title bar reads "E:\xslt\students.xml - Windows Internet Explorer". The address bar shows "E:\xslt\students.xml". The page content is titled "Students" and contains a table with five columns: Roll No, First Name, Last Name, Nick Name, and Marks. The table has four rows of data.

Roll No	First Name	Last Name	Nick Name	Marks
393	Dinkar	Kad	Dinkar	85
593	Jasvir	Singh	Jazz	90
493	Vaneet	Gupta	Vinni	95

7. XSLT –<if>

<xsl:if> tag specifies a conditional test against the content of nodes.

Declaration

Following is the syntax declaration of <xsl:if> element.

```
<xsl:if  
    test = boolean-expression >  
</xsl:if>
```

Attributes

Name	Description
test	The condition in the xml data to test.

Elements

Number of occurrences	Unlimited
Parent elements	xsl:attribute, xsl:comment, xsl:copy, xsl:element, xsl:fallback, xsl:for-each, xsl:if, xsl:message, xsl:otherwise, xsl:param, xsl:processing-instruction, xsl:template, xsl:variable, xsl:when, xsl:with-param, output elements
Child elements	xsl:apply-templates, xsl:attribute, xsl:call-template, xsl:choose, xsl:comment, xsl:copy, xsl:copy-of, xsl:element, xsl:for-each, xsl:if, xsl:processing-instruction, xsl:text, xsl:value-of, xsl:variable, output elements

Demo Example

This example creates a table of <student> element with its attribute **rollno** and its child <firstname>, <lastname>, <nickname>, and <marks> by iterating over each student. It checks marks to be greater than 90 and then prints the student(s) details.

students.xml

```
<?xml version="1.0"?>
<?xml-stylesheet type="text/xsl" href="students.xsl"?>
<class>
  <student rollno="393">
    <firstname>Dinkar</firstname>
    <lastname>Kad</lastname>
    <nickname>Dinkar</nickname>
    <marks>85</marks>
  </student>
  <student rollno="493">
    <firstname>Vaneet</firstname>
    <lastname>Gupta</lastname>
    <nickname>Vinni</nickname>
    <marks>95</marks>
  </student>
  <student rollno="593">
    <firstname>Jasvir</firstname>
    <lastname>Singh</lastname>
    <nickname>Jazz</nickname>
    <marks>90</marks>
  </student>
</class>
```

students.xsl

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform">

  <xsl:template match="/">
    <html>
      <body>
        <h2>Students</h2>
        <table border="1">
          <tr bgcolor="#9acd32">
```

```
<th>Roll No</th>
<th>First Name</th>
<th>Last Name</th>
<th>Nick Name</th>
<th>Marks</th>

</tr>
<xsl:for-each select="class/student">
<xsl:if test="marks > 90">
<tr>
<td>
<xsl:value-of select="@rollno"/>
</td>
<td><xsl:value-of select="firstname"/></td>
<td><xsl:value-of select="lastname"/></td>
<td><xsl:value-of select="nickname"/></td>
<td><xsl:value-of select="marks"/></td>
</tr>
</xsl:if>
</xsl:for-each>
</table>
</body>
</html>
</xsl:template>

</xsl:stylesheet>
```

Output

The screenshot shows a Windows Internet Explorer window displaying the output of an XSLT transformation. The title bar reads "E:\xslt\students.xml - Windows Internet Explorer". The address bar shows "E:\xslt\students.xml". The main content area has a heading "Students" followed by a table with the following data:

Roll No	First Name	Last Name	Nick Name	Marks
493	Vaneet	Gupta	Vinni	95

At the bottom of the browser window, it says "Computer | Protected Mode: Off" and has a zoom level of "100%".

8. XSLT –<choose>

<xsl:choose> tag specifies a multiple conditional tests against the content of nodes in conjunction with the <xsl:otherwise> and <xsl:when> elements.

Declaration

Following is the syntax declaration of <xsl:choose> element.

```
<xsl:choose>
</xsl:choose>
```

Elements

Number of occurrences	Unlimited
Parent elements	xsl:attribute, xsl:comment, xsl:copy, xsl:element, xsl:fallback, xsl:foreach, xsl:if, xsl:message, xsl:otherwise, xsl:param, xsl:processing-instruction, xsl:template, xsl:variable, xsl:when, xsl:with-param, output elements
Child elements	xsl:otherwise, xsl:when

Demo Example

This example creates a table of <student> element with its attribute **rollno** and its child <firstname>, <lastname>, <nickname>, and <marks> by iterating over each student. It checks and then prints the grade details.

students.xml

```
<?xml version="1.0"?>
<?xml-stylesheet type="text/xsl" href="students.xsl"?>
<class>
  <student rollno="393">
    <firstname>Dinkar</firstname>
    <lastname>Kad</lastname>
    <nickname>Dinkar</nickname>
    <marks>85</marks>
  </student>
  <student rollno="493">
```

```

<firstname>Vaneet</firstname>
<lastname>Gupta</lastname>
<nickname>Vinni</nickname>
<marks>95</marks>
</student>
<student rollno="593">
    <firstname>Jasvir</firstname>
    <lastname>Singh</lastname>
    <nickname>Jazz</nickname>
    <marks>90</marks>
</student>
</class>

```

students.xsl

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:template match="/">
    <html>
        <body>
            <h2>Students</h2>
            <table border="1">
                <tr bgcolor="#9acd32">
                    <th>Roll No</th>
                    <th>First Name</th>
                    <th>Last Name</th>
                    <th>Nick Name</th>
                    <th>Marks</th>
                    <th>Grade</th>
                </tr>
                <xsl:for-each select="class/student">
                    <tr>
                        <td>
                            <xsl:value-of select="@rollno"/>
                        </td>

```

```
<td><xsl:value-of select="firstname"/></td>
<td><xsl:value-of select="lastname"/></td>
<td><xsl:value-of select="nickname"/></td>
<td><xsl:value-of select="marks"/></td>
<td>
<xsl:choose>
  <xsl:when test="marks > 90">
    High
  </xsl:when>
  <xsl:when test="marks > 85">
    Medium
  </xsl:when>
  <xsl:otherwise>
    Low
  </xsl:otherwise>
</xsl:choose>
</td>
</tr>
</xsl:for-each>
</table>
</body>
</html>
</xsl:template>

</xsl:stylesheet>
```

Output

The screenshot shows a Windows Internet Explorer window displaying the output of an XSLT transformation. The title bar reads "E:\xslt\students.xml - Windows Internet Explorer". The address bar shows the URL "E:\xslt\students.xml". The page content is titled "Students" and contains a table with the following data:

Roll No	First Name	Last Name	Nick Name	Marks	Grade
393	Dinkar	Kad	Dinkar	85	Low
493	Vaneet	Gupta	Vinni	95	High
593	Jasvir	Singh	Jazz	90	Medium

At the bottom of the browser window, it says "Computer | Protected Mode: Off" and "100%".

9. XSLT – <key>

<xsl:key> tag element specifies a named name-value pair assigned to a specific element in an XML document. This key is used with the key() function in XPath expressions to access the assigned elements in an XML document.

Declaration

Following is the syntax declaration of <xsl:key> element

```
<xsl:key  
    name = QName  
    match = Pattern  
    use = Expression >  
</xsl:key>
```

Attributes

Name	Description
Name	Name of the key to be used.
Match	Patterns used to identify a node that holds this key.
Use	XPath expression to identify the value of the nodes of xml document.

Elements

Number of occurrences	Unlimited
Parent elements	xsl:stylesheet
Child elements	None

Demo Example

This example creates a table of <student> element with its attribute **rollno** and its child <firstname>, <lastname>, <nickname>, and <marks> by iterating over each student. It checks key as firstname to be one of the student's name and then prints the student details.

students.xml

```
<?xml version="1.0"?>
<?xml-stylesheet type="text/xsl" href="students.xsl"?>
<class>
  <student rollno="393">
    <firstname>Dinkar</firstname>
    <lastname>Kad</lastname>
    <nickname>Dinkar</nickname>
    <marks>85</marks>
  </student>
  <student rollno="493">
    <firstname>Vaneet</firstname>
    <lastname>Gupta</lastname>
    <nickname>Vinni</nickname>
    <marks>95</marks>
  </student>
  <student rollno="593">
    <firstname>Jasvir</firstname>
    <lastname>Singh</lastname>
    <nickname>Jazz</nickname>
    <marks>90</marks>
  </student>
</class>
```

students.xsl

```
<xsl:stylesheet version="1.0"
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:key name="firstname-search" match="student" use="firstname"/>
<xsl:template match="/">
  <html>
    <body>
      <h2>Students</h2>
      <table border="1">
        <tr bgcolor="#9acd32">
          <th>Roll No</th>
```

```

<th>First Name</th>
<th>Last Name</th>
<th>Nick Name</th>
<th>Marks</th>
</tr>
<xsl:for-each select="key('firstname-search', 'Dinkar')">
<tr>
<td>
<xsl:value-of select="@rollno"/>
</td>
<td><xsl:value-of select="firstname"/></td>
<td><xsl:value-of select="lastname"/></td>
<td><xsl:value-of select="nickname"/></td>
<td><xsl:value-of select="marks"/></td>
</tr>
</xsl:for-each>
</table>
</body>
</html>
</xsl:template>

</xsl:stylesheet>

```

Output

Roll No	First Name	Last Name	Nick Name	Marks
393	Dinkar	Kad	Dinkar	85

10. XSLT – <message>

<message> tag element helps to debug an XSLT processing. It is similar to javascript alerts. <xsl:> tag buffers a message to XSLT processor which terminates the processing and sends a message to the caller application to display the error message.

Declaration

Following is the syntax declaration of <xsl:message> element.

```
<xsl:message  
    terminate = "yes" | "no" >  
</xsl:message>
```

Attributes

Name	Description
terminate	It specifies whether the transformation should terminate upon executing this instruction or not. Default is "yes".

Elements

Number of occurrences	Unlimited
Parent elements	xsl:attribute, xsl:comment, xsl:copy, xsl:element, xsl:fallback, xsl:for-each, xsl:if, xsl:message, xsl:otherwise, xsl:param, xsl:processing-instruction, xsl:template, xsl:variable, xsl:when, xsl:with-param, output elements
Child elements	xsl:apply-templates, xsl:attribute, xsl:call-template, xsl:choose, xsl:comment, xsl:copy, xsl:copy-of, xsl:element, xsl:for-each, xsl:if, xsl:processing-instruction, xsl:text, xsl:value-of, xsl:variable, output elements

Demo Example

This example creates a table of <student> element with its attribute **rollno** and its child <firstname>, <lastname>, <nickname>, and <marks> by iterating over each student. It checks key as firstname to be present and then prints the student details, otherwise displays an error message.

students.xml

```
<?xml version="1.0"?>
<?xml-stylesheet type="text/xsl" href="students.xsl"?>
<class>
  <student rollno="393">
    <firstname>Dinkar</firstname>
    <lastname>Kad</lastname>
    <nickname>Dinkar</nickname>
    <marks>85</marks>
  </student>
  <student rollno="493">
    <firstname></firstname>
    <lastname>Gupta</lastname>
    <nickname>Vinni</nickname>
    <marks>95</marks>
  </student>
  <student rollno="593">
    <firstname>Jasvir</firstname>
    <lastname>Singh</lastname>
    <nickname>Jazz</nickname>
    <marks>90</marks>
  </student>
</class>
```

students.xsl

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:template match="/">
  <html>
    <body>
      <h2>Students</h2>
      <table border="1">
        <tr bgcolor="#9acd32">
          <th>Roll No</th>
```

```
<th>First Name</th>
<th>Last Name</th>
<th>Nick Name</th>
<th>Marks</th>

</tr>
<xsl:for-each select="class/student">
  <xsl:if test="firstname=''">
    <xsl:message terminate="yes">A first name field is empty.
    </xsl:message>
  </xsl:if>
<tr>
  <td>
    <xsl:value-of select="@rollno"/>
  </td>
  <td><xsl:value-of select="firstname"/></td>
  <td><xsl:value-of select="lastname"/></td>
  <td><xsl:value-of select="nickname"/></td>
  <td><xsl:value-of select="marks"/></td>
</tr>
</xsl:for-each>
</table>
</body>
</html>
</xsl:template>

</xsl:stylesheet>
```

Output

The screenshot shows a Windows Internet Explorer window displaying the output of an XSLT transformation. The title bar reads "E:\xslt\students.xml - Windows Internet Explorer". The address bar shows "E:\xslt\students.xml". The page content starts with a large bold heading "Students". Below it is a table with the following data:

Roll No	First Name	Last Name	Nick Name	Marks
393	Dinkar	Kad	Dinkar	85

Below the table, a message states: "The XML page cannot be displayed". Underneath that, another message says: "Cannot view XML input using XSL style sheet. Please correct the error and then click the [Refresh](#) button, or try again later." At the bottom of the browser window, it shows "Computer | Protected Mode: Off" and a zoom level of "100%".

11. XSLT –<apply-template>

<xsl:apply-template> tag signals the XSLT processor to find the appropriate template to apply, based on the type and context of each selected node.

Declaration

Following is the syntax declaration of <xsl:apply-template> element.

```
<xsl:apply-template  
    select = Expression  
    mode = QName >  
</xsl:apply-template>
```

Attributes

Name	Description
select	Used to process nodes selected by an XPath expression, instead of processing all the children.
mode	Allows an element as specified by its Qualified Names to be processed multiple times, each time producing a different result.

Elements

Number of occurrences	Unlimited
Parent elements	xsl:attribute, xsl:comment, xsl:copy, xsl:element, xsl:fallback, xsl:for-each, xsl:if, xsl:message, xsl:otherwise, xsl:param, xsl:processing-instruction, xsl:template, xsl:variable, xsl:when, xsl:with-param, output elements
Child elements	xsl:sort, xsl:with-param

Demo Example

This example creates a list of `<student>` element with its attribute `rollno` and its child `<firstname>`, `<lastname>`, `<nickname>`, and `<marks>` by iterating over each student.

students.xml

```
<?xml version="1.0"?>
<?xml-stylesheet type="text/xsl" href="students.xsl"?>
<class>
    <student rollno="393">
        <firstname>Dinkar</firstname>
        <lastname>Kad</lastname>
        <nickname>Dinkar</nickname>
        <marks>85</marks>
    </student>
    <student rollno="493">
        <firstname>Vaneet</firstname>
        <lastname>Gupta</lastname>
        <nickname>Vinni</nickname>
        <marks>95</marks>
    </student>
    <student rollno="593">
        <firstname>Jasvir</firstname>
        <lastname>Singh</lastname>
        <nickname>Jazz</nickname>
        <marks>90</marks>
    </student>
</class>
```

students.xsl

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:template match="/">
<html>
<body>
<h2>Students</h2>
<xsl:apply-templates select="class/student" />
</body>
</html>
</xsl:template>

<xsl:template match="class/student">
<xsl:apply-templates select="@rollno" />
<xsl:apply-templates select="firstname" />
<xsl:apply-templates select="lastname" />
<xsl:apply-templates select="nickname" />
<xsl:apply-templates select="marks" />
<br />
</xsl:template>

<xsl:template match="@rollno">
<span style="font-size=22px;">
<xsl:value-of select="." />
</span>
<br />
</xsl:template>

<xsl:template match="firstname">
First Name:<span style="color:blue;">
<xsl:value-of select="." />
</span>
<br />
</xsl:template>
```

```
<xsl:template match="lastname">
    Last Name:<span style="color:green;">
        <xsl:value-of select=". " />
    </span>
    <br />
</xsl:template>

<xsl:template match="nickname">
    Nick Name:<span style="color:red;">
        <xsl:value-of select=". " />
    </span>
    <br />
</xsl:template>

<xsl:template match="marks">
    Marks:<span style="color:gray;">
        <xsl:value-of select=". " />
    </span>
    <br />
</xsl:template>

</xsl:stylesheet>
```

Output

The screenshot shows a Windows Internet Explorer window displaying XML data from E:\xslt\students.xml. The title bar reads "E:\xslt\students.xml - Windows Internet Explorer". The page content is titled "Students" and lists three student records:

- 393**
First Name:Dinkar
Last Name:Kad
Nick Name:Dinkar
Marks:85
- 493**
First Name:Vaneet
Last Name:Gupta
Nick Name:Vinni
Marks:95
- 593**
First Name:Jasvir
Last Name:Singh
Nick Name:Jazz
Marks:90

The status bar at the bottom shows "Computer | Protected Mode: Off" and "100%".

12. XSLT – <import>

<xsl:import> tag imports the contents of one stylesheet into another. Importing a style sheet has higher precedence over imported stylesheet.

Declaration

Following is the syntax declaration of <xsl:import> element.

```
<xsl:import href="uri">  
</xsl:import>
```

Attributes

Name	Description
href	Used to pass the path of XLST stylesheet to be imported.

Elements

Number of occurrences	Unlimited
Parent elements	xsl:stylesheet, xsl:transform
Child elements	None

Demo Example

This example creates a list of <student> element with its attribute **rollno** and its child <firstname>, <lastname>, <nickname>, and <marks> by iterating over each student. Here we have created two xsl stylesheets where students_imports.xsl stylesheet imports students.xsl and students.xml is linked to students_imports.xsl.

students.xml

```
<?xml version="1.0"?>  
<?xml-stylesheet type="text/xsl" href="students_imports.xsl"?>  
<class>  
  <student rollno="393">  
    <firstname>Dinkar</firstname>
```

```

<lastname>Kad</lastname>
<nickname>Dinkar</nickname>

<marks>85</marks>
</student>
<student rollno="493">
    <firstname>Vaneet</firstname>
    <lastname>Gupta</lastname>
    <nickname>Vinni</nickname>
    <marks>95</marks>
</student>
<student rollno="593">
    <firstname>Jasvir</firstname>
    <lastname>Singh</lastname>
    <nickname>Jazz</nickname>
    <marks>90</marks>
</student>
</class>

```

students.xsl

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">

<xsl:template match="/">
    <html>
        <body>
            <h2>Students</h2>
            <table border="1">
                <tr bgcolor="#9acd32">
                    <th>Roll No</th>
                    <th>First Name</th>
                    <th>Last Name</th>
                    <th>Nick Name</th>
                    <th>Marks</th>
                </tr>

```

```

<xsl:for-each select="class/student">
  <tr>
    <td>
      <xsl:value-of select="@rollno"/>
    </td>
    <td><xsl:value-of select="firstname"/></td>
    <td><xsl:value-of select="lastname"/></td>
    <td><xsl:value-of select="nickname"/></td>
    <td><xsl:value-of select="marks"/></td>
  </tr>
</xsl:for-each>
</table>
</body>
</html>
</xsl:template>

</xsl:stylesheet>

```

students_imports.xsl

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform">

  <xsl:import href="students.xsl"/>

  <xsl:template match="/">
    <xsl:apply-imports/>
  </xsl:template>

</xsl:stylesheet>

```

Output

The screenshot shows a Windows Internet Explorer window displaying the output of an XSLT transformation. The title bar reads "E:\xslt\students.xml - Windows Internet Explorer". The address bar shows the file path "E:\xslt\students.xml". The main content area displays a heading "Students" followed by a table with five columns: Roll No, First Name, Last Name, Nick Name, and Marks. The table contains three rows of student data.

Roll No	First Name	Last Name	Nick Name	Marks
393	Dinkar	Kad	Dinkar	85
493	Vaneet	Gupta	Vinni	95
593	Jasvir	Singh	Jazz	90
